On behalf of **Momtaz Engineering for Construction and Services Company** I would like to confirm that S4GA company has successfully executed **Hybrid Airfield Ground Lighting** delivery for military airport located in North Africa.

Main profile of our company is construction works. We have been awarded with the airport-related project. The aim of this project was to illuminate airport where all previously installed lighting has been outdated and did not function properly. Therefore, we needed to install new airfield ground lighting system. One of the limitations we had was lack of stationary power grid at this airport as it is located in the desert area.

Airport included:

- Two parallel 3.500-meter runways
- Five taxiways
- One apron

Scope of works that has to be performed included installation of runway and taxiway lighting together with control & monitoring interface, new markings, guidance signs and illuminated windsock.

When looking for suitable solution we found out about S4GA company and their Hybrid Airfield Lighting. S4GA has offered us lighting system design support, delivery of complete system and supervision of installation works.

After few months S4GA has prepared airside-related design, successfully delivered ordered equipment and helped us to perform installation. Installation works have been done by our local team. It has been almost a year since we installed S4GA lighting system and it has been functioning properly since then. All minor technical that we had we were able to handle locally with support from S4GA technical team.

As we are located far away from Poland we were concerned that it might cause certain problems however S4GA has been very supportive and promptly responded to all our questions and addressed concerns of our technicians. Overall we are satisfied about cooperation with S4GA company and recommend this company and their product as reliable solution for other airports.
